Cell Phone LCD Projector

APR 14 2006

MORE: [CELL PHONE](#) , [GADGETS](#)

South Korean company Ijlin Display is working on miniscule LCD projectors that can be placed inside cell phones and digital cameras. The projectors will cast a seven inch, full color display onto walls, floors, and the backs of a large people on the bus. The technology for the projectors is currently as large as a pack of cigarettes, but the company aims to get it down to the size of a matchbox by the end of the year. Unfortunately, enlarging your contact list with a projector won't change the fact that you only have numbers for your mom and Dunkin Donuts. Also, it's been around a half an hour since you last talked to your mom, so you might want to give her a call.

uzaktan robotik ameliyat

NASA's Robot Surgeon

APR 20 2006

MORE: [ROBOTS](#)

NASA has been testing a remote-controlled robot surgeon in an undersea laboratory off the coast of Florida. For one exercise, surgical researchers 1,250 miles away sent commands to the robot, which managed to successfully suture a badly damaged vein in the wounded arm of a "patient simulator."

With the possibility of human injury on future Lunar and Martian outposts, NASA is hoping that the use of surgical robots and "telemedicine" will delay the need for medical doctor astronauts. The article states that the robots should eventually be able to perform "most operations." I hope "most operations" includes "the surgery required to repair an unfeeling robot doctor's horrible mistakes." Oh, and hopefully collagen injections too.

mayin imha edicisi

Robotic Mine-Sensing Shoes

APR 28 2006

MORE: [ROBOTS](#)

Scientists are working on a robotic shoe that detects and avoids landmines. The shoe contains six legs that each have a metal detecting base. As the wearer places a foot down, all six of the legs test the ground to determine if a mine is present. If a mine is detected, the leg over the mine will raise, applying no pressure to ground and preventing the wearer from triggering the mine. Since landmines kill tens of thousands of people every year, these shoes are welcome inventions. With this technology, you'll also be able to effortlessly walk over the homeless people that *used to* remind you just how cruel and unforgiving the world really is. Plus you'll be like a foot taller!

lcd ve mezar tasi yok artik dedirtiyor.

Vidstone 7" LCD Panel for Tombstones

APR 25 2006

MORE: [GADGETS](#)

Tombstones are about to enter the digital age, my friend. Vidstone is offering the Serenity Panel, a solar-powered 7" LCD panel that can be placed on a gravestone, mausoleum, or columbarium. The Serenity Panel will display a five to eight minute photo slideshow detailing "the most precious memories of your loved one's life" and fully creeping out everyone who happens to pass by on the way to less haunting memorials. The product sounds suspicious, and judging from the picture, Vidstone is actually the ghost of a company that died four years ago. The only ghost companies I trust employ [Peter Venkman](#).

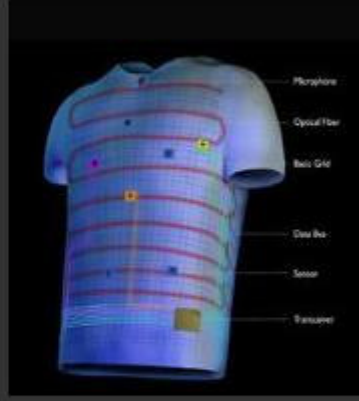

bu tisort baska tisort.saglik durumunuzu bu tisortle takip edebilirler

SmartShirt Remote Monitoring System

MAY 3 2006

MORE: [CONCEPT](#)

Sensatex, a leading electronic textile company, has initiated a Beta launch of its flagship SmartShirt System. The SmartShirt measures and transmits a wearer's heart rate, movement, and respiration rate using a conductive fiber grid that is knit into the material of the shirt. The shirt could eventually be used to remotely monitor the health of senior citizens, outpatients, training athletes, truck drivers, and soldiers. An additional idea would be to make a little SmartShirt sweater for your cat. That way, when you leave your cat alone for a few weeks, you can remotely check on him to make sure he's still doing okay. Swap out the word 'cat' with 'neglected toddler,' and the concept still applies.

hemsireler damari bulamadim, giremedim derler va iste ona cozum

VeinViewer Technology Launched

MAY 2 2006

The Medical Technology company Luminetx has begun shipping the VeinViewer, an instrument that uses infrared light to clearly project the location of veins onto the surface of skin. Although the VeinViewer can be used to find veins for drawing blood and inserting IV's, its main purpose is to assist with difficult procedures that require a great deal of precision, like inserting catheters and removing varicose and spider veins. It has also been suggested that VeinViewer could be used to find the fragile, elusive veins of children, the elderly, and **unconscious fans**. The VeinViewer is currently priced at \$25,000, so it may take a while before you see one in your neighborhood doctor's office.

Transforming Car Braces for Accidents

MAY 11 2006

MORE: [ROBOTS](#)

German researchers are working on a car that can anticipate a side-on impact and slightly transform its body to better absorb the impact. Side impact accidents occur at the same frequency as front and rear accidents, but cause the

most injuries out the three. In an attempt to address this problem, the experimental system uses cameras and radar to track oncoming cars to determine if an impact is imminent. If the system calculates that a crash is inevitable, it will activate a "shape-shifting meta" in the door to reinforce the area that will be struck. After the accident, the car will continue the transformation process until it becomes a fire-breathing robot scorpion, because, hey, if you're going to make your car transform into something, it might as well be a giant scorpion.

lcd video gozluk

Kowon Video LCD Glasses

MAY 11 2006

MORE: [CELL PHONE](#) , [GADGETS](#)

Korean electronics manufacturer Kowon has announced a product that will let you enjoy a nice television show while you attempt to drastically increase your risk of getting hit by a bus. These video glasses let viewers watch television and movies in an experience that's touted to be similar to watching a 32" LCD TV from a distance of 2 meters. The glasses use connection cables that can link to a variety of appliances, including televisions, DVD players, and apparently cell phones. It's easy to see that video glasses lend well to cell phone use, since most text messages only make sense when LOLs and OMGs appear larger than giant pumpkins. Release date is unknown, but we'll keep our eyes open for one. Get it? Eyes? Ha hah! Oh *laughter*.

ayna ayna soyle bana yaslaninca ne olcam bu dunyada

Digital Mirror Displays Future You

MAY 10 2006

The Persuasive Mirror, a project being developed by Accenture, displays an age and behavior-progressed representation of the viewer. The image presented by the mirror will be adjusted based on a "series of

sensors and data analysis tools" that monitor the viewer's activity throughout the house. For example, the mirror could be combined with "health-tracking personal sensors," and if the user eats poorly and neglects exercise, the mirror could project an image of the user as overweight. The idea is to persuade people to live better lives by scaring them into submission with grotesque images of their future selves. This technology is still in its planning phase, so even if it could evaluate your life based on your significant other, it'd still be **too late... too late.**

video oyunu oynayanlar daha iyi cerrah oluvmus bilginize)

Video Games Help Surgeons

MAY 25 2006

MORE: GAMING

A new study has found that surgeons who play video games prior to performing surgery were faster and made fewer mistakes than those who did not. The research was conducted on 303 surgeons who were practicing laparoscopic surgery, a form of internal surgery in which narrow instruments and a tiny video camera are inserted through a small incision in the

body. Results from the study showed that surgeons who warmed up on games like "Super Monkey Ball" for at least twenty minutes completed training exercises an average of eleven seconds faster than the regular surgeons. The study also showed that surgeons who played video games were less likely to be busy on Saturday nights, more likely to have personal hygiene issues, and more susceptible to the harsh scorn of the opposite sex.

Electronic Curtains Change Opacity

MAY 30 2006

MORE: JAPANESE

Micro Reactor System Co. is a Japanese company that specializes in "electronic curtains" that alternate between translucent and opaque states depending on whether or not they're powered by an electrical current. The curtains are constructed by dispersing liquid crystal

molecules between two panels of plastic, which allow the curtains to be relatively thin and flexible. The color of the opaque mode can be chosen from a variety of different colors, and the curtains should be available later this year for between \$267 and \$445 per square meter. These curtains might not be worthwhile window shades if the police already think that you're flashing the senior citizen center across the street from your apartment, since having a power outage drop the shades when you're in the middle of your naked morning "yoga session" won't help anything whatsoever.

Switchable mirror glass makes energy efficient windows

FEB 2 2007

MORE: CONCEPT , DESIGN , FUTURE TECH

A group from the National Institute of Advanced Industrial Science and Technology (AIST) has designed glass which can switch between window and mirror. The switch is done by altering the gas content between the two glass panes. By introducing a small amount of hydrogen into the atmosphere between the panes, the glass acts as a transparent window. Alternatively, adding a small amount of oxygen with no hydrogen forms a reflecting mirror. The idea is to save energy in buildings by reflecting away heat on heavily sunny days. But really I'd just use it to spy on women in my bathroom. Wait, I didn't just say that.

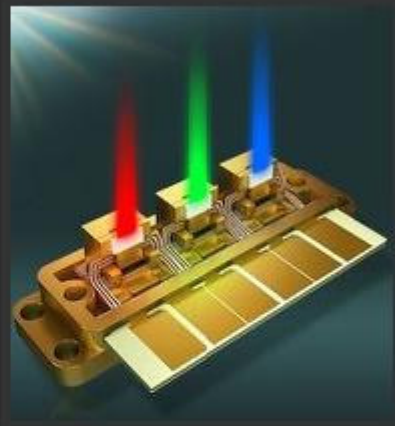

mini projektor

Laser-Based Mini Projectors

JUN 6 2006

MORE: [CELL PHONE](#) , [GADGETS](#) , [LAPTOP](#) , [PORTABLE AUDIO](#)

Laser manufacturer Novalux is working towards creating colored lasers that could be used in tiny, laser-based projectors for handheld devices like cell phones, MP3 players, and PDAs. These laser-based projectors could produce bright and clear images the size of laptop screens in well-lit areas and projections of up to 10 feet in darkness. The projectors also won't require focusing because of the laser technology. If this technology takes off, people could

watch movies projected onto the backs of airplane seats, subway walls, and even fast food restaurant tables. I'm excited that this technology has the potential to revolutionize handheld gadgets, I just don't think it's a good idea to project your business all over the place. If the person next to me on a plane can easily see that I'm watching just a 30 second looped sequence of David Hasselhoff running on the beach, he's probably not going to tell me when the dinner cart comes by.

Dell computer explodes during conference

JUN 21 2006

MORE: [DELL](#) , [EXPLOSION](#) , [LAPTOP](#) , [PC](#) , [PWNED](#)

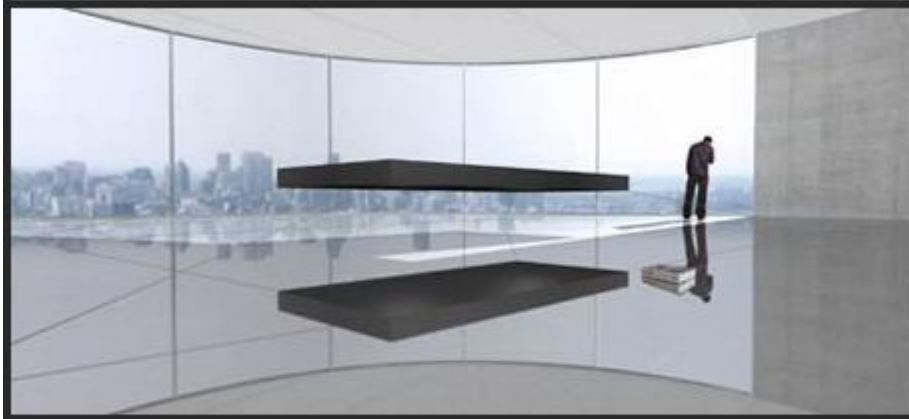

If you happen to own a Dell laptop try to make sure it doesn't explode, because that's **exactly what happened** at a conference in Japan. No explanation has been given yet, just some witnesses who say the thing suddenly burst into flames and produced "several more explosions for more than five minutes."

This exact same thing happened to me and the laptop I built using firecrackers and lighter fluid. And I was so convinced booting up with a match would've worked.

magnetik olani mi gizlice duvara baglanmis olani mi tercih ederdiniz?

Magnetic floating bed

JUL 5 2006

A Dutch inventor has created a floating bed that uses magnetic levitation to float in the air. It's ridiculously impractical and costs either 115,000 euro or 1,200,000 euro (I don't read Dutch so I'm not sure which), but those are the reasons why I want it so bad. Plus I've always been a fan of anything that levitates. Cars, magicians, you name it. Except maybe sharks. Let's just keep those sons of bitches in the water.

Flattua is a floating bed

SEP 14 2006

MORE: DESIGN

The Flattua bed is supported by a single beam attached to the wall, creating a neat effect that looks like your bed is floating on air. My only concern is if it'll hold up to my rock hard 600 lb physique. Considering my current bed is just a pile of cushions on the floor I'm going to assume not.

Ruf Cinema takes watching TV in bed to next level

DEC 12 2006

If having a TV in your bedroom isn't good enough for you, Ruf Cinema has developed a bed with a built in projector that can raise and lower. It's absolutely as pointless as you'd imagine, but if you get it you can finally say with 100% confidence that you're the lamest person on your block. Possibly even the entire city.

Giant expensive egg helps you relax

MAR 28 2007

MORE: DESIGN , GADGETS , HOME , USELESS

If you're having a tough time meditating and have \$12,000 to spend, check out the Transport, an egg-shaped fiberglass vessel outfitted with speakers and an array of light-emitting diodes. It's described as a "perceptual pod," which means it doesn't do anything you couldn't already do by lying down and closing your eyes. It looks pretty cool though. Like something you sit in while coming up with evil plans and stroking a cat.

batan buz nasıl oluyor? dersiniz kimyaya girmek gerek derim**How to make sinking ice**

JUL 11 2006

If you're anything like me you've spent the majority of your life trying to figure out how to make your ice sink. Well turns out there's an easy solution: you buy heavy water and freeze it. No seriously. Heavy water is the same as regular water except it uses different isotopes of Hydrogen making it up to 10% heavier than regular water. You shouldn't actually drink it because who knows what radiocative water will do to you but now you finally have an advantage in all those ice fights you have with your friends. Ice fights? What the crap am I talking about?

yumartan olunca sana soyluyor.ben rafadanım rafadanım diye**Egg tells you when it's done being cooked**

JUL 31 2006

The people at British

Lion Quality Eggs

have developed

eggs that let people

know when they're

done. The new eggs

are sold in three

varieties: soft,

medium and hard. A

hungry moron need only buy the egg type that corresponds with his preference and place it in boiling water. A special heat-activated logo appears when the egg is cooked to your liking. It even reminds you how it is that you've cooked your egg so there are no unpleasant surprises when you crack it open.

At least these guys didn't waste their lives developing something useless.

Because the number one priority in the world today is making sure people are able to properly cook their eggs. I'm not sure I'd be willing to buy a \$5 egg though, even if it was gauranteed to cook perfectly.

guzel bir organizer

Keyboard organizer

AUG 16 2006

MORE: PC

The Keyboard Organizer is a stupid little keyboard that flips open so you can store supplies, like one of those old desks you had back in elementary school. Although I suspect if you can't afford a desk large enough to store your pencil and eraser, you probably can't afford a computer either. Plus having to stop whatever you're doing to pull out some crap from your keyboard just sounds annoying.

NanoNuno Umbrella never gets wet

SEP 20 2006

The NanoNuno umbrella uses nanotechnology based off the lotus plant to always keep dry, using the principle that the microscopic, rough nanostructure on the leaves of the lotus plant simply cause dirt and moisture to roll off because there is a much smaller surface area to which things can stick to than on a smooth surface. So after the umbrella gets wet you just give it a quick shake and it should be good to go. And for only about \$100 you can't afford not to buy it! Although that's about the only thing you'll be able to buy because you've just dropped \$100 on an umbrella.

SENZ Umbrella is aerodynamic

APR 30 2007

MORE: [ACCESSORIES](#) , [UMBRELLA](#)

The [SENZ Umbrella](#) is an aerodynamic umbrella which the manufacturer claims can withstand storms up to wind force 10. I'm not even sure what that means, but if there's one thing I've always said about my umbrellas, it's that I wish they were more aerodynamic. And also made out of chocolate.
